CATCH THE BEAT
Practical AI for Local Governments

CITY OF YELLOWKNIFE / CASE STUDY

From operational gaps to focused AI projects.

CTB helped Yellowknife connect its technology strategy with everyday operational needs. The partnership now continues through three focused projects.

01 STARTING POINT

Staff across finance, GIS, asset management and procurement were working with manual data entry, repeated interpretation and disconnected systems. The City needed practical opportunities for improvement that fit its technology roadmap and governance priorities.

02 PROCESS

CTB met with departmental staff, documented workflows and identified phased automation opportunities, considering existing Microsoft 365 tools first. The work also contributed to the City's AI policy and AI and Digital Governance Framework, with security and oversight central to the approach.

03 END POINT TO DATE

The City received a structured assessment and recommendations grounded in staff experience. Its endorsement recognized CTB's ability to connect strategy with practical implementation. Current work focuses on automated invoicing, as-built GIS and asset replacement costs; outcomes remain to be validated.

"Daphne demonstrated a strong ability to bridge strategy and practical implementation."

Cole Caljouw | Director, Governance and Corporate Services
City of Yellowknife | Letter of recommendation, April 20, 2026

Turn an operational challenge into a practical next step.

CITY OF YELLOWKNIFE / WORK NOW UNDERWAY

Three projects. Practical operational value.

01 AUTOMATED INVOICING

Work is underway to automate invoicing. The assessment identified opportunities to reduce repetitive invoice handling and data entry, introduce structured validation and direct staff attention to exceptions. Faster processing and less rework are intended benefits, not confirmed results.

02 AS-BUILT GIS

The report identifies approximately 406 as-built plans, mainly PDFs, requiring manual interpretation for GIS updates. The ongoing project seeks to make asset information easier to extract and use, with GIS staff validating details before updates are relied upon.

03 ASSET REPLACEMENT COSTS

The partnership now also includes work on asset replacement costs to support budgeting and renewal planning. This is an active area of development; a completed costing tool, validated estimates and measured savings are not yet reported in the supplied material.

50–70% POTENTIAL REDUCTION

As-built workflow effort under the report’s short-term scenario

The assessment estimates this range for partial automation of as-built data extraction. It is a conceptual projection, not a tested result or a saving across the whole GIS department. No annual hours are calculated because a validated time baseline is not supplied.

Technical assessment, pilot testing and staff review are needed to establish actual performance. The report’s other potential savings are not added to this figure.
